DISTRICT LEVEL POPULATION PROJECTIONS

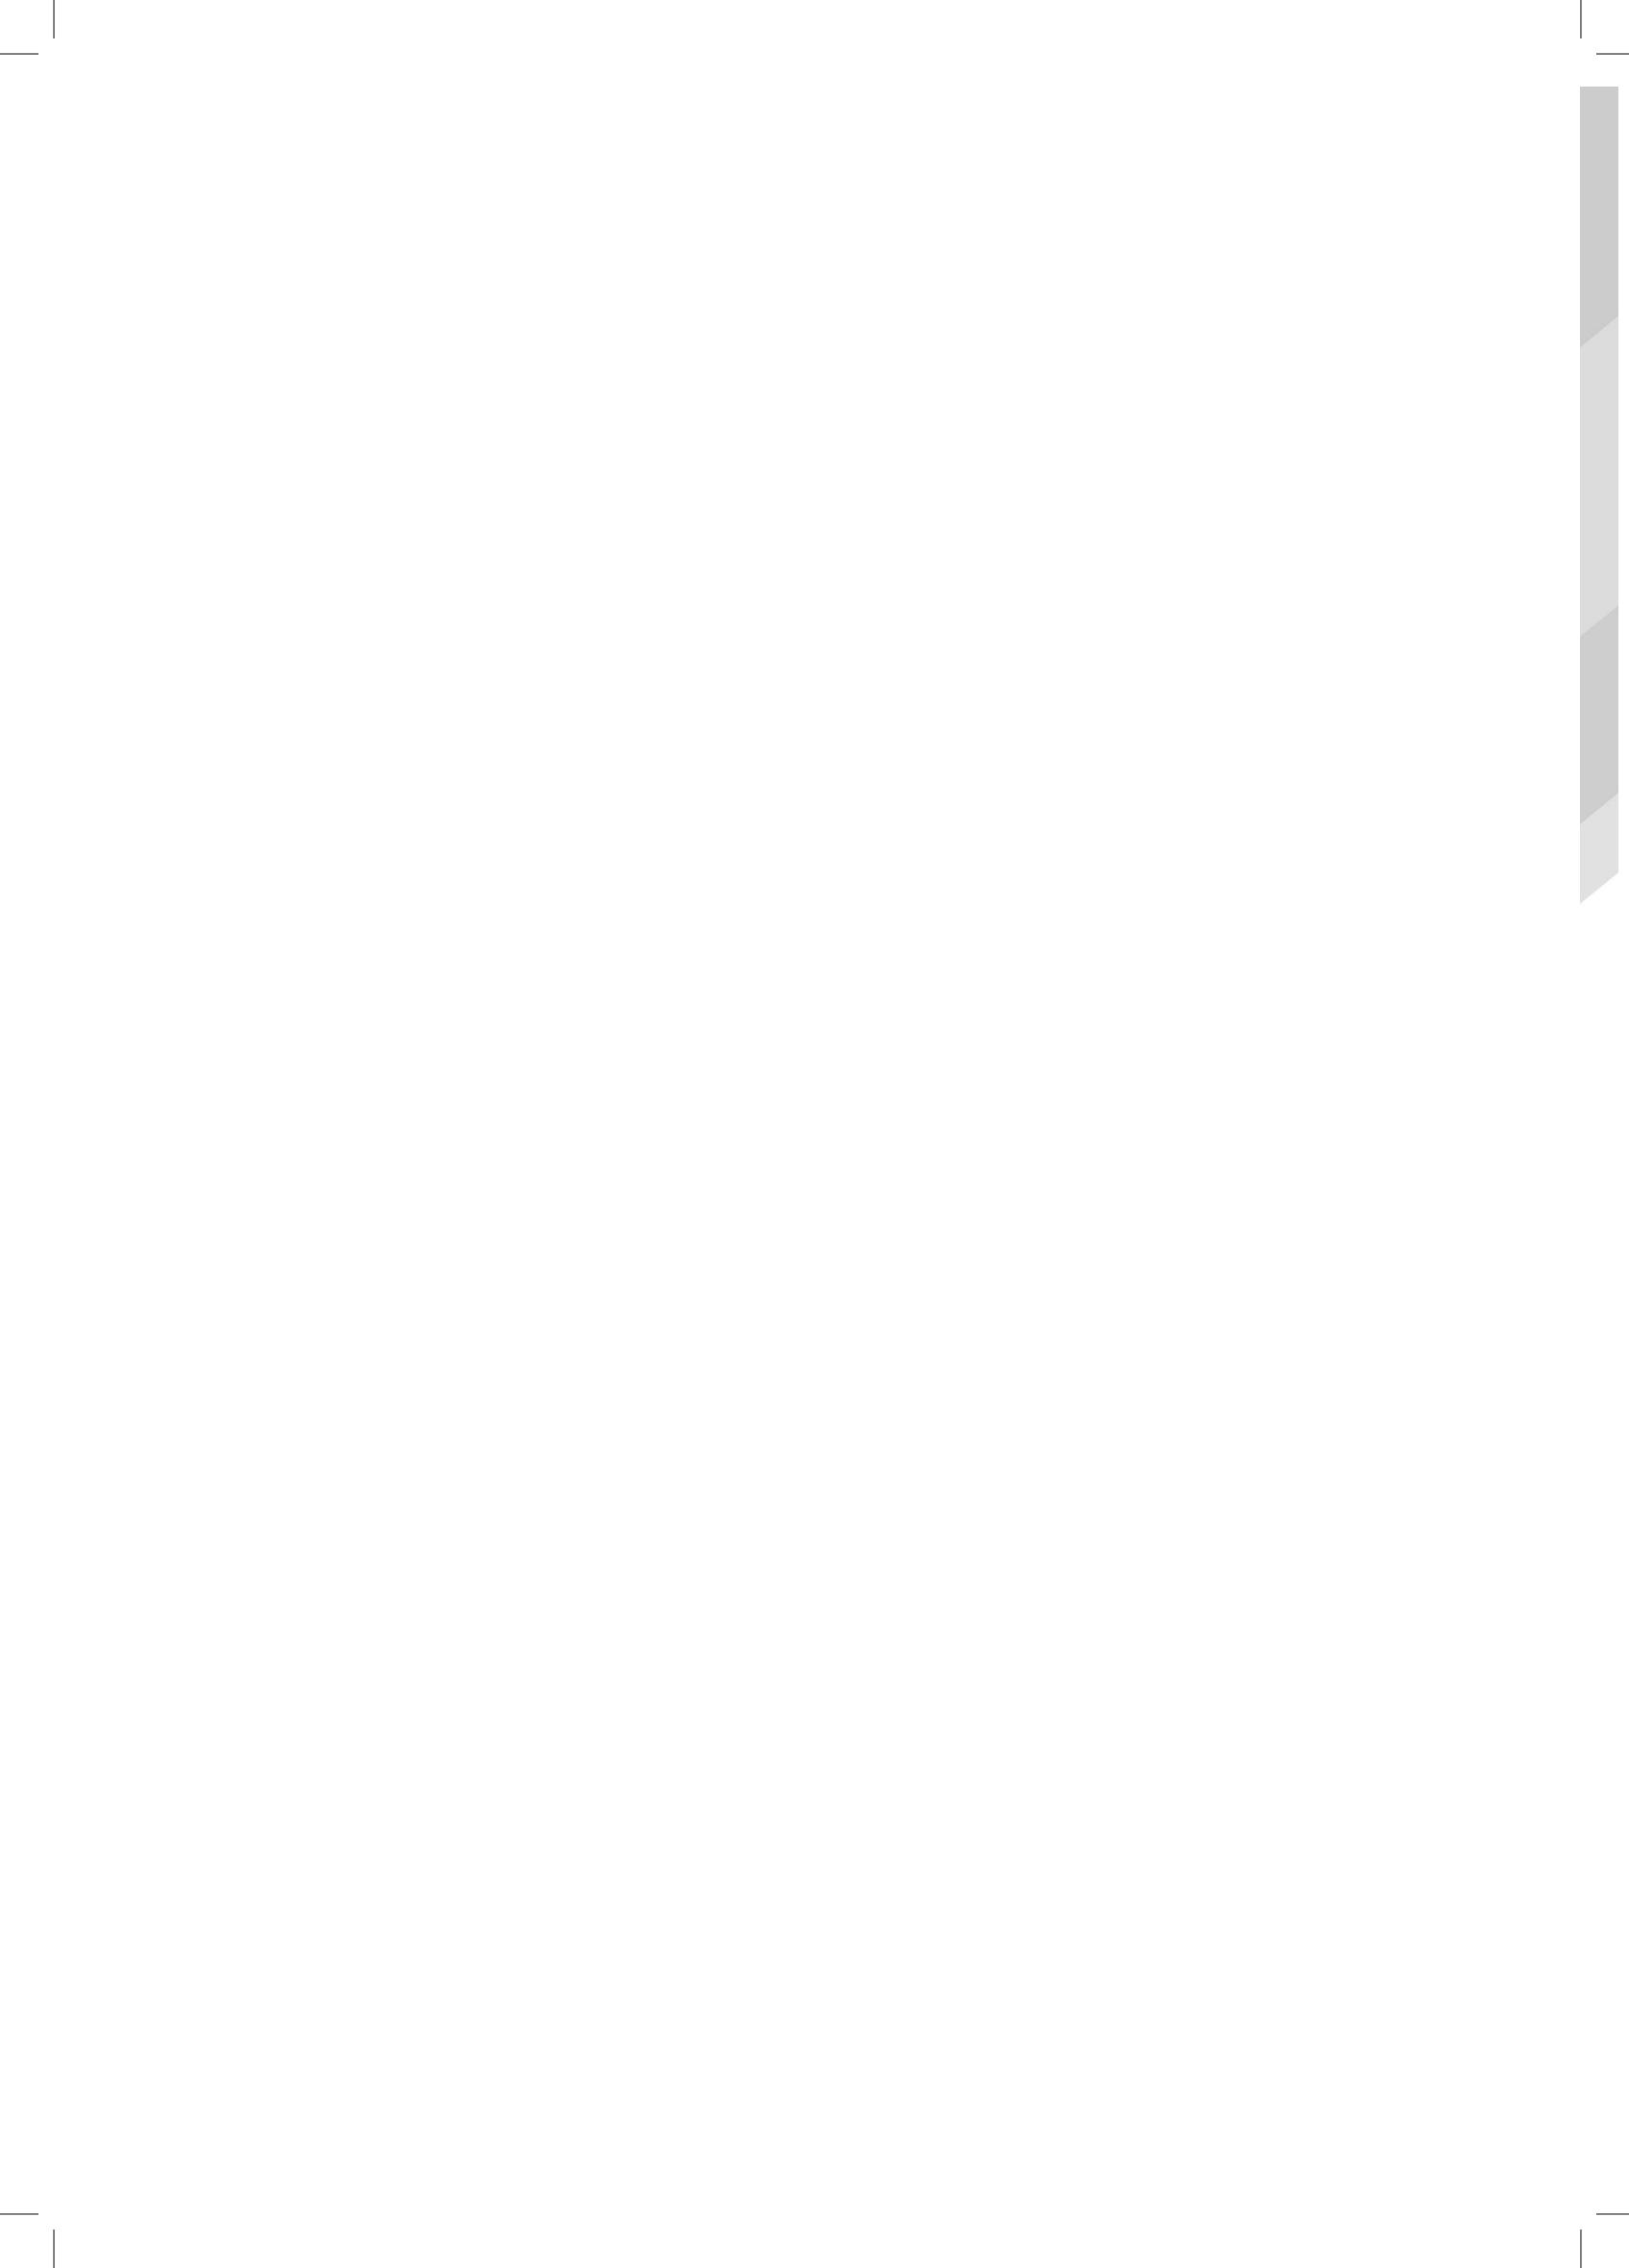

IN SELECTED STATES OF INDIA 2021 & 2026

United Nations Population Fund - India

UNFPA is the United Nations sexual and reproductive health agency. Our mission is to deliver a world where every pregnancy is wanted, every childbirth is safe and every young person's potential is fulfilled. UNFPA supports countries in using population data for policies and programmes to reduce poverty and to ensure that every pregnancy is wanted, every birth is safe, every young person is free of HIV/AIDS, and every girl and woman is treated with dignity and respect.

District Population Projections in four states

Bihar, Madhya Pradesh, Odisha and Rajasthan

Background

Population projection is a scientific attempt to estimate future trends of population based on certain assumptions using past data on trends in fertility, mortality and migration.

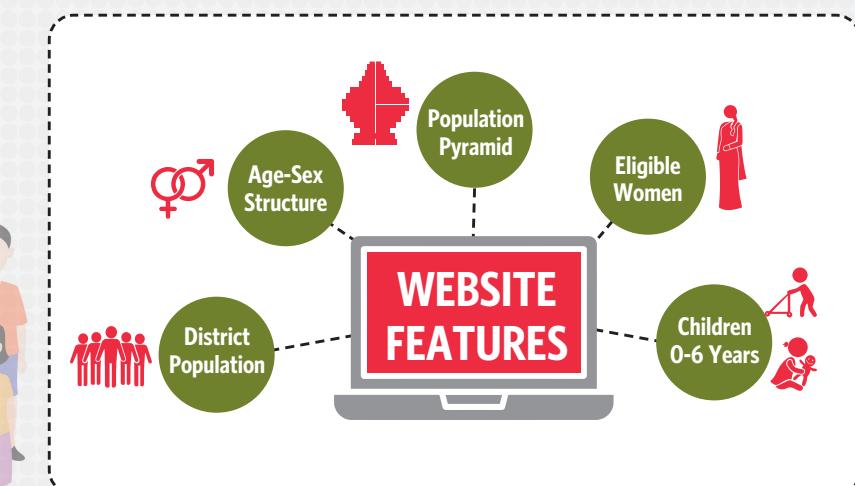

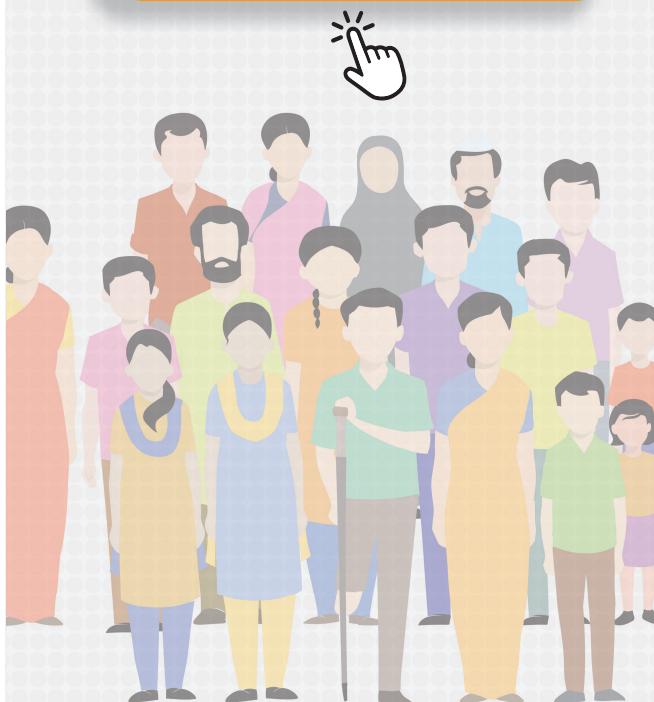

Assumptions are made to the best of mathematical and statistical modelling, however, there might be some departures in future trends in demographic parameters, which may result into some errors in future population estimates.

Government of India constituted a Technical Group on Population Projections (TGPP), which carried out state level projections for the period 2011-2036 and the report was published in 2020.

The projection of population by age at the district level has been done very rarely, probably due to lack of data and selection of method that would provide reliable results, even for short duration. The district-level projected population is very critical to calculate denominator for several indicators for data-driven planning, programming and implementation.

District level population projections are helpful in planning and monitoring of development plans at local levels.

An interactive digital version of this publication has been developed for easy access of data and downloading the desired information by anyone and anywhere.

INTRODUCTION

Planning for the overall development of the country is an important process. Demographic and health data are required for planning, programme implementation, monitoring and evaluation. Importance of population trends and anticipating demographic change at national, subnational and especially at district level are very important for planning and program management and implementation. The age-sex composition of population is required for the formulation of new programmes and they are also needed for the monitoring and scientific evaluation of a number of ongoing programmes of the various ministries, and tracking the progress in achieving the Sustainable Development Goals (SDGs).

With the emphasis on decentralized planning based on constitutional amendments, the district has become the primary unit of planning and monitoring development programmes in India. In order to adopt bottom-up approach for planning, availability of administrative or service statistics data at district levels and appropriate denominators for converting data into indicators are very important.

The Census of India is one of the major sources of social, economic and demographic data. A population census is a systematic enumeration of the resident members of a country at a particular point of time. It is conducted to collect information on age, sex, marital status, education, occupation, fertility, migration, rural-urban residence, working status and so on. The census is the largest population database, and it is conducted every tenth year in India. The regular decennial census undertaking began from 1881 and has continued uninterrupted till 2011. The 2021 round of census was deferred due to COVID-19 pandemic.

Population projection is a scientific attempt to estimate future trends of population based on

certain assumptions using past data on trends in fertility, mortality and migration. The future trajectory of human fertility and mortality are affected by health interventions, food production, economic development, socio-cultural context, and various other factors. Assumptions are made to the best of mathematical and statistical modelling, however, there might be some departures in future trends in demographic parameters, which may result into some errors in future population estimates. The Cohort Component Method is the universally accepted method of making population projections because growth of population is determined by fertility, mortality, and migration rates. In India, state level estimates of fertility and mortality are provided by the Sample Registration System (SRS) on yearly basis, which becomes one of the major sources of trend as an input to the population projection exercise.

Official committees of the Government of India (constituted by the NITI Aayog or other commissions and departments) and individual experts have been carrying out the projection exercise (Registrar General of India, 1968, 1979, 1988, 1996, 2006; Cassen & Dyson, 1976; Srinivasan et.al 1984). The population projections are carried out usually at state levels in India. When one attempts to carry out long-term projections, it has been generally observed that the quality of projection deteriorates, as the duration of population projection increases (Stoto 1983; Agarwal 2000).

In order to provide official population projections which can be used by various stakeholders and government departments, a Technical Group on Population Projections (TGPP) for the period 2011-2036 was constituted. The technical group considered data provided by Census 2011, SRS, National Family Health Survey and other sources as need to carry out the projections at the state level.

The population projections report was published in 2020 which provides estimates up to the year 2036 with age, sex, urban-rural and State and UT break ups for five-year intervals.

The projection of population by age at the district level has been done very rarely; probably due to lack of data and selection of method that would provide reliable results, even for short duration. The district-level projected population is very critical to calculate denominator for several indicators for data-driven planning, programming and implementation. Further, district level projected age-wise population needs to be consistent with projected population at the state level. In 2009, UNFPA published District Level Population Projections in Eight Selected States of India (2001 - 2016)¹. A technical group comprising of eminent demographers, representative from the Ministry of Health and Family Welfare and other experts provided methodological inputs to carry out the population projections by age-sex at the

district level. The state level population projections made by the Technical Group constituted by the National Commission on Population (Registrar General of India, 2006) was used, as the basis for projections for districts within the respective states. The district level estimates of population served as denominators for many indicators and were extensively used by various departments, UN Agencies and Civil Society Organizations for planning and monitoring of the development programmes at the district levels.

Given the past experiences of use of district level estimates of population and publication of official population projections at the state level by the Government of India in 2020, it was decided to carry out district level population projections for the years 2021 and 2026 for selected states. As was done earlier, a long-term district level population projection was avoided due to various uncertainties about population trends below the state level.

METHODOLOGY

A number of methods are used to project the population and the choice of method depends on administrative unit (i.e. national, state, district, urban, etc.) for which projections are being made and the availability of data. The commonly used methods are:

1. Cohort component projection method
2. Mathematical methods
3. Ratio method

The Cohort Component Method of population projections requires detailed analysis of trends in fertility and mortality in order to make informed assumptions about the future. In addition, selection of a suitable life table is also a key factor for the accuracy of the projection. This approach is generally adopted for national level projections as well for large states in India. However, since information on fertility and mortality estimates is lacking at the district level, the choice of method falls on one of the other two methods or their variants. It has also been observed that the quality of projection is also a function of the level of population growth rate of the district. A detailed exercise has shown that the ratio method provides reasonably good projections for small areas such as the districts (Agarwal, 2000).

While adopting the ratio method, however, adjustment of sub-national population projection (size) to national (or just higher level) is desirable as the population projections at higher levels are based on more detailed information about fertility, mortality and migration and by employing superior methods.

In the present exercise the 'Ratio Method' is used to project population and age-sex structure of the districts in four states of India. First, the shares of the district population to the state population were computed for the years 1991, 2001 and 2011. Based on the shares of the district at these Census

dates, annual change in the share is computed and projected to the years 2021 and 2026. The projected shares of the district population are then applied to the state populations projected by the Population Commission, Government of India, 2020 to get the projected district populations for the years 2021 and 2026. This was done separately for males and females.

Subsequently, proportion of population in each group in a district was computed after adjusting the age disaggregated information for 'age not stated' category. The age structure of the population in future years was obtained by applying the total projected population of the district to the projected age proportions.

For the district projections to be consistent with the state projections, it is essential that the sum of the projected district populations in an age group be the same as that projected by the Population Commission for the state, for that age group and the sum of populations in all age groups in the district equals the projected total district population for that year. For this purpose, row-wise and column-wise raking was done alternately. Two-three iterations were adequate to obtain a high degree of consistency.

The national and state level population projections by the Technical Group were carried out using smoothed age distributions that minimize the effect of age misreporting. But the district shares used in the present exercise were based on unsmoothed distributions. Possibly because of this, the projected population of some cohorts at two points, say 2021 and 2026, showed apparent discrepancies in a few districts. In order to bring in internal consistency, the projections for an age group were fitted into specified ranges obtained from the cohort population five years earlier.

The population projections are carried out for conventional five-year age groups. To obtain single year age distribution of the projected population, particularly in the younger ages, Sprague multipliers were used for each projection year.

District level projections by the ratio method are determined by the state projections and extrapolations of the district shares. As trends in the district shares may not be steady mainly due to changes in inter-district migrations and intra-state imbalances in development, projection of district shares over a long period is not advisable. Therefore, the present exercise was limited up to the year 2026.

Some limitations of these projections need to be noted here. It is recognized that projections for smaller areas suffer from larger relative errors as compared to projections for larger areas. Thus, the district level projections would have larger relative errors than national or state level projections. The single year populations for ages 0, 1, 2.., 14 were obtained by the Sprague method separately for each sex and at each time point, and hence sex ratios and year-to-year changes based on the single year projections should not be used to draw inferences. It is, therefore, suggested that as far as possible one should pool the single year

populations into 5-year age groups, 0-4, 5-9, 10-14, unless one specifically needs projections by single year of age. Further, it is to be noted that the totals for age-groups and for males and females may not exactly add up due to rounding off. The estimated number of eligible women aged 15 – 49 years have been derived based on the proportion of currently married women in this age group as per 2011 census for each district. This may be useful in estimating the level of efforts related to the reproductive health programme in each district.

Finally, any population projections are based on assumptions about demographic processes, namely, fertility, mortality, and migration, over the projection period. As the projections for states provided by the Technical Group of the Government of India, have been used as the basis for projections for districts within states, the assumptions made by the Technical Group are implicitly taken for granted at the state level. Within the states, the district shares are assumed to follow recent trends. It is known that during the process of development there could be changes in the trends of district shares, and in such cases, the district shares may change in a manner different than projected here. This limitation is inherent in small area projections such as the district projections presented in this report.
